## NAK V -SEAL

The V-SEAL is mounted directly on the shaft and seals axially against the counterface. V-SEAL is made entirely of rubber and comprises a body and a conical lip joined to the body. The V-SEAL is mounted on and rotates with the shaft. The lip seals against a counterface perpendicular to the shaft. The body holds the lip in position and at the same time seals against the shaft.

The V-SEAL offers a number of economical advantages.

1. The demand of V-SEAL on the tolerances and surface finish of the sealing surfaces are small.
2. A counterface finished by fine turning and polishing will produce efficient sealing in most case. No special requirements are necessary concerning the machining of the shaft.
3. The V-SEAL does not wear the shaft which is expensive component in the machine. Grooves worn in the shaft tend to impair the strength of the shaft and are, moreover, difficult to remove. When changing a seal, expensive and

time-consuming disassembly can often be avoided.

4. Complicated designs can be avoided because by using the V-SEAL the designer can adapt the seal to the design.

The V-SEAL is manufactured in two different grades of rubber.

1. Nitrile rubber is the standard grade. It has excellent resistance to wear and withstands the majority of media to which a seal is exposed. The temperature range  $-40 \sim +100$  °C.
2. Fluor rubber (VITON) is used where the operating temperatures are high, and in conjunction with certain aggressive media. Temperature range  $-20$  to  $\sim +240$  °C in static applications,  $-40$  to  $\sim +200$  °C in dynamic application.

\* V-SEAL in other grades of rubber made to special order.
